

# Chapter 4: SARIMA Models

Seminar

# Seminar Outline

- 1 Review Quiz
- 2 Practice Problems
- 3 Worked Examples
- 4 Real Data Analysis
- 5 Discussion Topics
- 6 Exercises for Self-Study

## Quiz 1: Seasonal Differencing

### Question

For monthly data with annual seasonality, what does the operator  $(1 - L^{12})$  do?

- ☐ A) Takes 12 consecutive differences
- ☐ B) Computes  $Y_t - Y_{t-12}$
- ☐ C) Averages over 12 months
- ☐ D) Removes the first 12 observations

## Quiz 1: Seasonal Differencing

### Question

For monthly data with annual seasonality, what does the operator  $(1 - L^{12})$  do?

- ☐ A) Takes 12 consecutive differences
- ☒ B) Computes  $Y_t - Y_{t-12}$
- ☐ C) Averages over 12 months
- ☐ D) Removes the first 12 observations

### Answer: B

The seasonal differencing operator  $(1 - L^{12})Y_t = Y_t - Y_{t-12}$  compares each observation with the same month in the previous year, removing annual seasonal patterns.

## Quiz 2: SARIMA Notation

### Question

What does  $\text{SARIMA}(1, 1, 1) \times (1, 1, 1)_{12}$  represent?

- ☐ A) 12 different ARIMA models
- ☐ B) ARIMA with 12 AR and 12 MA terms
- ☐ C) ARIMA(1,1,1) with seasonal ARIMA(1,1,1) at period 12
- ☐ D) A model requiring 12 years of data

## Quiz 2: SARIMA Notation

### Question

What does  $\text{SARIMA}(1, 1, 1) \times (1, 1, 1)_{12}$  represent?

- ☐ A) 12 different ARIMA models
- ☐ B) ARIMA with 12 AR and 12 MA terms
- ☒ C) ARIMA(1,1,1) with seasonal ARIMA(1,1,1) at period 12
- ☐ D) A model requiring 12 years of data

### Answer: C

$\text{SARIMA}(p, d, q) \times (P, D, Q)_s$  combines regular  $\text{ARIMA}(p, d, q)$  with seasonal  $\text{ARIMA}(P, D, Q)$  at seasonal period  $s$ . Here we have both regular and seasonal  $\text{AR}(1)$ ,  $\text{I}(1)$ , and  $\text{MA}(1)$  components with  $s = 12$ .

## Quiz 3: The Airline Model

### Question

The “airline model” refers to  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$ . How many parameters does it have (excluding variance)?

- ☐ A) 2 parameters
- ☐ B) 4 parameters
- ☐ C) 6 parameters
- ☐ D) 12 parameters

## Quiz 3: The Airline Model

### Question

The “airline model” refers to  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$ . How many parameters does it have (excluding variance)?

- ☒ A) 2 parameters
- ☐ B) 4 parameters
- ☐ C) 6 parameters
- ☐ D) 12 parameters

### Answer: A

The airline model has only 2 parameters:  $\theta_1$  (regular MA coefficient) and  $\Theta_1$  (seasonal MA coefficient). Despite its simplicity, it captures many seasonal patterns remarkably well.

## Quiz 4: ACF of Seasonal Data

### Question

For monthly data with strong seasonality, where would you expect to see significant ACF spikes?

- ☐ A) Only at lag 1
- ☐ B) Only at lag 12
- ☐ C) At lags 12, 24, 36, ...
- ☐ D) Randomly distributed

## Quiz 4: ACF of Seasonal Data

### Question

For monthly data with strong seasonality, where would you expect to see significant ACF spikes?

- ☐ A) Only at lag 1
- ☐ B) Only at lag 12
- ☒ C) At lags 12, 24, 36, ...
- ☐ D) Randomly distributed

### Answer: C

Seasonal data shows significant autocorrelation at the seasonal frequency and its multiples. For monthly data with annual seasonality, expect spikes at lags 12, 24, 36, etc., reflecting correlation between same months across years.

## Quiz 5: Multiplicative Structure

### Question

In SARIMA, what does “multiplicative structure” mean?

- ☐ A) The seasonal amplitude grows proportionally
- ☐ B) Regular and seasonal polynomials are multiplied
- ☐ C) We multiply the data by seasonal factors
- ☐ D) The model is estimated using multiplication

## Quiz 5: Multiplicative Structure

### Question

In SARIMA, what does “multiplicative structure” mean?

- ☐ A) The seasonal amplitude grows proportionally
- ☒ B) Regular and seasonal polynomials are multiplied
- ☐ C) We multiply the data by seasonal factors
- ☐ D) The model is estimated using multiplication

### Answer: B

Multiplicative structure means the AR polynomials  $\phi(L) \times \Phi(L^s)$  and MA polynomials  $\theta(L) \times \Theta(L^s)$  are multiplied together, creating cross-terms that capture interactions between regular and seasonal dynamics.

## Quiz 6: Seasonal vs Regular Differencing

### Question

When would you apply both regular ( $d = 1$ ) and seasonal ( $D = 1$ ) differencing?

- ☐ A) When data has only a trend
- ☐ B) When data has only seasonality
- ☐ C) When data has both trend and seasonal non-stationarity
- ☐ D) Never – they cancel each other

## Quiz 6: Seasonal vs Regular Differencing

### Question

When would you apply both regular ( $d = 1$ ) and seasonal ( $D = 1$ ) differencing?

- ☐ A) When data has only a trend
- ☐ B) When data has only seasonality
- ☒ C) When data has both trend and seasonal non-stationarity
- ☐ D) Never – they cancel each other

### Answer: C

Both types of differencing are needed when the series exhibits both a stochastic trend (regular unit root) and stochastic seasonality (seasonal unit root). For example, airline passenger data needs  $(1 - L)(1 - L^{12})Y_t$  to achieve stationarity.

## Quiz 7: Detecting Seasonality from ACF

### Question

The ACF of a monthly time series shows slow decay at lags 12, 24, and 36. What does this suggest?

- ☐ A) The series is stationary
- ☐ B) The series needs regular differencing only
- ☐ C) The series has a seasonal unit root requiring  $D = 1$
- ☐ D) The series is white noise

## Quiz 7: Detecting Seasonality from ACF

### Question

The ACF of a monthly time series shows slow decay at lags 12, 24, and 36. What does this suggest?

- ☐ A) The series is stationary
- ☐ B) The series needs regular differencing only
- ☒ C) The series has a seasonal unit root requiring  $D = 1$
- ☐ D) The series is white noise

### Answer: C

Slow decay of ACF at seasonal lags ( $s, 2s, 3s, \dots$ ) indicates a seasonal unit root. This requires seasonal differencing  $(1 - L^{12})$  to achieve stationarity. Fast cutoff at seasonal lags would suggest a stationary seasonal pattern.

## Quiz 8: Multiplicative vs Additive Seasonality

### Question

If the seasonal amplitude of a time series grows proportionally with the level, this indicates:

- ☐ A) Additive seasonality – use  $(1 - L^s)$
- ☐ B) Multiplicative seasonality – use log transformation
- ☐ C) No seasonality present
- ☐ D) Need for regular differencing only

## Quiz 8: Multiplicative vs Additive Seasonality

### Question

If the seasonal amplitude of a time series grows proportionally with the level, this indicates:

- ☐ A) Additive seasonality – use  $(1 - L^s)$
- ☒ B) Multiplicative seasonality – use log transformation
- ☐ C) No seasonality present
- ☐ D) Need for regular differencing only

### Answer: B

When seasonal peaks and troughs grow with the level, we have multiplicative seasonality:  $Y_t = T_t \times S_t \times \varepsilon_t$ . Taking logarithms converts this to additive:  $\log Y_t = \log T_t + \log S_t + \log \varepsilon_t$ , making standard SARIMA applicable.

## Quiz 9: Seasonal Subseries Plot

### Question

In a seasonal subseries plot, what indicates multiplicative seasonality?

- ☐ A) Lines for each month are parallel
- ☐ B) Lines for each month diverge (spread increases over time)
- ☐ C) All months have the same mean
- ☐ D) Lines are horizontal

## Quiz 9: Seasonal Subseries Plot

### Question

In a seasonal subseries plot, what indicates multiplicative seasonality?

- ☐ A) Lines for each month are parallel
- ☒ B) Lines for each month diverge (spread increases over time)
- ☐ C) All months have the same mean
- ☐ D) Lines are horizontal

### Answer: B

In a seasonal subseries plot, each line shows one month across all years. If the lines diverge (fan out), the spread between high and low months is increasing, indicating multiplicative seasonality. Parallel lines indicate additive seasonality.

## Quiz 10: Invertibility in SARIMA

### Question

For  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$  to be invertible, which condition must hold?

- ☐ A)  $|\theta_1| < 1$  only
- ☐ B)  $|\Theta_1| < 1$  only
- ☐ C) Both  $|\theta_1| < 1$  and  $|\Theta_1| < 1$
- ☐ D) No invertibility condition exists for MA models

## Quiz 10: Invertibility in SARIMA

### Question

For  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$  to be invertible, which condition must hold?

- ☐ A)  $|\theta_1| < 1$  only
- ☐ B)  $|\Theta_1| < 1$  only
- ☒ C) Both  $|\theta_1| < 1$  and  $|\Theta_1| < 1$
- ☐ D) No invertibility condition exists for MA models

### Answer: C

Both the regular MA polynomial  $\theta(L) = 1 + \theta_1 L$  and seasonal MA polynomial  $\Theta(L^s) = 1 + \Theta_1 L^{12}$  must have roots outside the unit circle. This requires  $|\theta_1| < 1$  AND  $|\Theta_1| < 1$  for invertibility.

## Quiz 11: HEGY Test

### Question

The HEGY test is used to:

- ☐ A) Estimate SARIMA parameters
- ☐ B) Test for unit roots at different frequencies (trend and seasonal)
- ☐ C) Check residual normality
- ☐ D) Compare SARIMA models using information criteria

## Quiz 11: HEGY Test

### Question

The HEGY test is used to:

- ☐ A) Estimate SARIMA parameters
- ☒ B) Test for unit roots at different frequencies (trend and seasonal)
- ☐ C) Check residual normality
- ☐ D) Compare SARIMA models using information criteria

### Answer: B

The HEGY (Hylleberg-Engle-Granger-Yoo) test examines unit roots at different frequencies: zero frequency (trend unit root) and seasonal frequencies. It helps determine whether to use deterministic seasonality (dummies) or stochastic seasonality (seasonal differencing).

## Quiz 12: Seasonal MA Identification

### Question

After applying  $(1 - L)(1 - L^{12})$ , the ACF shows a single significant spike at lag 12 only (no spike at lag 1). The PACF decays at seasonal lags. This suggests:

- ☐ A)  $\text{SARIMA}(0, 1, 0) \times (0, 1, 1)_{12}$
- ☐ B)  $\text{SARIMA}(0, 1, 1) \times (0, 1, 0)_{12}$
- ☐ C)  $\text{SARIMA}(1, 1, 0) \times (1, 1, 0)_{12}$
- ☐ D)  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$

## Quiz 12: Seasonal MA Identification

### Question

After applying  $(1 - L)(1 - L^{12})$ , the ACF shows a single significant spike at lag 12 only (no spike at lag 1). The PACF decays at seasonal lags. This suggests:

- ☒ A)  $\text{SARIMA}(0, 1, 0) \times (0, 1, 1)_{12}$
- ☐ B)  $\text{SARIMA}(0, 1, 1) \times (0, 1, 0)_{12}$
- ☐ C)  $\text{SARIMA}(1, 1, 0) \times (1, 1, 0)_{12}$
- ☐ D)  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$

### Answer: A

ACF cutting off at lag 12 (not at lag 1) with decaying PACF at seasonal lags suggests only a seasonal MA(1) component with no regular MA. The model is  $\text{SARIMA}(0, 1, 0) \times (0, 1, 1)_{12}$ .

## Quiz 13: Over-differencing

### Question

After differencing, the ACF shows a large negative spike at lag 1 or lag  $s$ . This typically indicates:

- ☐ A) The model needs more AR terms
- ☐ B) The series has been over-differenced
- ☐ C) The series is perfectly stationary
- ☐ D) Heteroskedasticity is present

## Quiz 13: Over-differencing

### Question

After differencing, the ACF shows a large negative spike at lag 1 or lag  $s$ . This typically indicates:

- ☐ A) The model needs more AR terms
- ☒ B) The series has been over-differenced
- ☐ C) The series is perfectly stationary
- ☐ D) Heteroskedasticity is present

### Answer: B

A large negative ACF at lag 1 (close to  $-0.5$ ) or at lag  $s$  after differencing is a classic sign of over-differencing. This introduces artificial negative autocorrelation. Solution: reduce  $d$  or  $D$  by one.

## Quiz 14: Forecasting Horizon

### Question

For a SARIMA model with  $D = 1$ , what happens to forecast confidence intervals as the horizon  $h \rightarrow \infty$ ?

- ☐ A) They converge to a fixed width
- ☐ B) They grow without bound
- ☐ C) They shrink to zero
- ☐ D) They oscillate seasonally

## Quiz 14: Forecasting Horizon

### Question

For a SARIMA model with  $D = 1$ , what happens to forecast confidence intervals as the horizon  $h \rightarrow \infty$ ?

- ☐ A) They converge to a fixed width
- ☒ B) They grow without bound
- ☐ C) They shrink to zero
- ☐ D) They oscillate seasonally

### Answer: B

With seasonal differencing ( $D \geq 1$ ), the series has a seasonal unit root, meaning it's seasonally integrated. Like regular unit roots, this causes forecast uncertainty to grow without bound as the horizon increases.

## Quiz 15: Seasonal Period Selection

### Question

You have daily data showing clear weekly patterns. What seasonal period  $s$  should you use in a SARIMA model?

- ☐ A)  $s = 12$  (monthly)
- ☐ B)  $s = 7$  (weekly)
- ☐ C)  $s = 365$  (yearly)
- ☐ D)  $s = 24$  (hourly)

## Quiz 15: Seasonal Period Selection

### Question

You have daily data showing clear weekly patterns. What seasonal period  $s$  should you use in a SARIMA model?

- ☐ A)  $s = 12$  (monthly)
- ☒ B)  $s = 7$  (weekly)
- ☐ C)  $s = 365$  (yearly)
- ☐ D)  $s = 24$  (hourly)

### Answer: B

The seasonal period should match the repeating pattern's frequency. Weekly patterns in daily data repeat every 7 days, so  $s = 7$ . Always choose  $s$  based on the dominant seasonal cycle in your data.

## Quiz 16: Seasonal AR Component

### Question

In the seasonal component  $\Phi(L^s) = 1 - \Phi_1 L^s$ , what does the coefficient  $\Phi_1 = 0.8$  tell us?

- ☐ A) 80% of this period's value comes from the previous period
- ☐ B) There is 80% correlation between consecutive observations
- ☐ C) 80% of this period's value is explained by the same period last year
- ☐ D) The seasonal pattern explains 80% of variance

## Quiz 16: Seasonal AR Component

### Question

In the seasonal component  $\Phi(L^s) = 1 - \Phi_1 L^s$ , what does the coefficient  $\Phi_1 = 0.8$  tell us?

- ☐ A) 80% of this period's value comes from the previous period
- ☐ B) There is 80% correlation between consecutive observations
- ☒ C) 80% of this period's value is explained by the same period last year
- ☐ D) The seasonal pattern explains 80% of variance

### Answer: C

The seasonal AR coefficient  $\Phi_1$  measures the dependence on the observation from one seasonal cycle ago. With  $\Phi_1 = 0.8$ , about 80% of January's value (for example) is explained by last January's value, capturing persistence in seasonal patterns.

## Quiz 17: Seasonal Stationarity

### Question

A seasonal process with  $\Phi_1 = 1$  in  $\text{SARIMA}(0, 0, 0) \times (1, 0, 0)_{12}$  is:

- ☐ A) Stationary
- ☐ B) Has a seasonal unit root (seasonally integrated)
- ☐ C) Explosive
- ☐ D) Undefined

## Quiz 17: Seasonal Stationarity

### Question

A seasonal process with  $\Phi_1 = 1$  in  $\text{SARIMA}(0, 0, 0) \times (1, 0, 0)_{12}$  is:

- ☐ A) Stationary
- ☒ B) Has a seasonal unit root (seasonally integrated)
- ☐ C) Explosive
- ☐ D) Undefined

### Answer: B

When  $|\Phi_1| = 1$ , the process has a seasonal unit root, meaning it's seasonally integrated (requires seasonal differencing). This is analogous to a regular unit root ( $\phi = 1$ ) but at the seasonal frequency. The solution is to apply  $(1 - L^s)$  differencing.

## Quiz 18: Model Comparison

### Question

Model A:  $\text{SARIMA}(1, 1, 1) \times (1, 1, 1)_{12}$  has  $\text{AIC} = 520$ . Model B:  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$  has  $\text{AIC} = 525$ . Which statement is most accurate?

- ☐ A) Model A is always better since it has lower AIC
- ☐ B) Model B should be preferred due to parsimony despite higher AIC
- ☐ C) The AIC difference of 5 suggests Model A is substantially better
- ☐ D) We cannot compare models with different orders

## Quiz 18: Model Comparison

### Question

Model A:  $\text{SARIMA}(1, 1, 1) \times (1, 1, 1)_{12}$  has  $\text{AIC} = 520$ . Model B:  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$  has  $\text{AIC} = 525$ . Which statement is most accurate?

- ☐ A) Model A is always better since it has lower AIC
- ☐ B) Model B should be preferred due to parsimony despite higher AIC
- ☒ C) The AIC difference of 5 suggests Model A is substantially better
- ☐ D) We cannot compare models with different orders

### Answer: C

An AIC difference of 5 is meaningful—Model A provides a better fit even after penalizing for its extra parameters. However, we should also check residual diagnostics and consider if the simpler model (B) is “good enough” for practical purposes.

## Quiz 19: Seasonal Patterns in Residuals

### Question

After fitting a SARIMA model, you notice significant ACF spikes at lags 12 and 24 in the residuals. What does this indicate?

- ☐ A) The model is correctly specified
- ☐ B) The seasonal component is inadequate
- ☐ C) The data is not seasonal
- ☐ D) Overfitting has occurred

## Quiz 19: Seasonal Patterns in Residuals

### Question

After fitting a SARIMA model, you notice significant ACF spikes at lags 12 and 24 in the residuals. What does this indicate?

- ☐ A) The model is correctly specified
- ☒ B) The seasonal component is inadequate
- ☐ C) The data is not seasonal
- ☐ D) Overfitting has occurred

### Answer: B

Significant residual ACF at seasonal lags (12, 24, ...) indicates the SARIMA model hasn't fully captured the seasonal structure. Consider increasing  $P$  or  $Q$  in the seasonal component, or checking if  $D$  is appropriate.

## Quiz 20: Practical Forecasting

### Question

You're forecasting monthly retail sales with  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$ . For the 13-month-ahead forecast, which historical observations are most influential?

- ☐ A) Only the most recent observation
- ☐ B) The observation from the same month last year
- ☐ C) All observations equally
- ☐ D) Only observations from the same month in all previous years

## Quiz 20: Practical Forecasting

### Question

You're forecasting monthly retail sales with  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$ . For the 13-month-ahead forecast, which historical observations are most influential?

- ☐ A) Only the most recent observation
- ☒ B) The observation from the same month last year
- ☐ C) All observations equally
- ☐ D) Only observations from the same month in all previous years

### Answer: B

For SARIMA with  $d = D = 1$ , the 13-month forecast heavily depends on the value from 12 months ago (same month last year) plus recent shocks. The seasonal structure ensures forecasts capture both trend and seasonal patterns, with seasonal memory being particularly important for seasonal-horizon forecasts.

## True/False Questions (1-6)

Determine whether each statement is True or False:

- ❶ The seasonal period  $s$  for quarterly data with annual patterns is  $s = 4$ .
- ❷ SARIMA models can only handle one seasonal frequency.
- ❸ If AIC selects  $\text{SARIMA}(1, 1, 1) \times (1, 1, 1)_{12}$  and BIC selects the airline model, BIC is always wrong.
- ❹ The Kruskal-Wallis test can detect seasonality without assuming normality.
- ❺ After fitting a SARIMA model, residuals should show no significant ACF at seasonal lags.
- ❻ Log transformation converts multiplicative seasonality to additive.

## True/False Solutions (1-6)

- ① **TRUE**: Quarterly data with annual cycle has  $s = 4$  quarters per year.
- ② **TRUE**: Standard SARIMA handles one  $s$ ; multiple seasonalities need TBATS or Fourier terms.
- ③ **FALSE**: BIC penalizes complexity more; simpler model may be better for interpretation/forecasting.
- ④ **TRUE**: Kruskal-Wallis is nonparametric, comparing distributions across seasons.
- ⑤ **TRUE**: Residual ACF should be within confidence bands at ALL lags including seasonal.
- ⑥ **TRUE**:  $\log(T \times S \times \varepsilon) = \log T + \log S + \log \varepsilon$  (additive form).

## Problem 1: Expanding the Seasonal Difference

### Exercise

Expand  $(1 - L)(1 - L^{12})Y_t$  fully. What observations are involved?

## Problem 1: Expanding the Seasonal Difference

### Exercise

Expand  $(1 - L)(1 - L^{12})Y_t$  fully. What observations are involved?

### Solution

$$(1 - L)(1 - L^{12}) = 1 - L - L^{12} + L^{13}$$

$$\text{Therefore: } (1 - L)(1 - L^{12})Y_t = Y_t - Y_{t-1} - Y_{t-12} + Y_{t-13}$$

**Interpretation:** This is the difference of differences:

- First seasonal difference:  $Y_t - Y_{t-12}$  (this year vs last year)
- Then regular difference:  $(Y_t - Y_{t-12}) - (Y_{t-1} - Y_{t-13})$

## Problem 2: Airline Model Expansion

### Exercise

Write out the full equation for the airline model  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$ :

$$(1 - L)(1 - L^{12})Y_t = (1 + \theta_1 L)(1 + \Theta_1 L^{12})\varepsilon_t$$

## Problem 2: Airline Model Expansion

### Exercise

Write out the full equation for the airline model  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$ :

$$(1 - L)(1 - L^{12})Y_t = (1 + \theta_1 L)(1 + \Theta_1 L^{12})\varepsilon_t$$

### Solution

Expand the MA side:  $(1 + \theta_1 L)(1 + \Theta_1 L^{12}) = 1 + \theta_1 L + \Theta_1 L^{12} + \theta_1 \Theta_1 L^{13}$

Full model:  $Y_t - Y_{t-1} - Y_{t-12} + Y_{t-13} = \varepsilon_t + \theta_1 \varepsilon_{t-1} + \Theta_1 \varepsilon_{t-12} + \theta_1 \Theta_1 \varepsilon_{t-13}$

**Note:** The cross-term  $\theta_1 \Theta_1 L^{13}$  is the multiplicative interaction between regular and seasonal MA components.

## Problem 3: Parameter Count

### Exercise

How many parameters (excluding  $\sigma^2$ ) are in  $\text{SARIMA}(2, 1, 1) \times (1, 0, 1)_4$ ?

## Problem 3: Parameter Count

### Exercise

How many parameters (excluding  $\sigma^2$ ) are in  $\text{SARIMA}(2, 1, 1) \times (1, 0, 1)_4$ ?

### Solution

- Regular  $\text{AR}(p = 2)$ :  $\phi_1, \phi_2 \Rightarrow 2$  parameters
- Regular  $\text{MA}(q = 1)$ :  $\theta_1 \Rightarrow 1$  parameter
- Seasonal  $\text{AR}(P = 1)$ :  $\Phi_1 \Rightarrow 1$  parameter
- Seasonal  $\text{MA}(Q = 1)$ :  $\Theta_1 \Rightarrow 1$  parameter

**Total: 5 parameters**

Note: The differencing orders ( $d = 1, D = 0$ ) don't add parameters – they're transformations applied to the data.

## Problem 4: SARIMA Forecasting

### Exercise

Given the airline model with  $\theta_1 = -0.4$  and  $\Theta_1 = -0.6$ , and:

- $Y_T = 500, Y_{T-1} = 495, Y_{T-11} = 480, Y_{T-12} = 470$
- $\varepsilon_T = 5, \varepsilon_{T-11} = -3, \varepsilon_{T-12} = 2$

Forecast  $Y_{T+1}$ .

## Problem 4: SARIMA Forecasting

### Exercise

Given the airline model with  $\theta_1 = -0.4$  and  $\Theta_1 = -0.6$ , and:

- $Y_T = 500, Y_{T-1} = 495, Y_{T-11} = 480, Y_{T-12} = 470$
- $\varepsilon_T = 5, \varepsilon_{T-11} = -3, \varepsilon_{T-12} = 2$

Forecast  $Y_{T+1}$ .

### Solution

From the model:  $Y_{T+1} = Y_T + Y_{T-11} - Y_{T-12} + \varepsilon_{T+1} + \theta_1 \varepsilon_T + \Theta_1 \varepsilon_{T-11} + \theta_1 \Theta_1 \varepsilon_{T-12}$

Setting  $\mathbb{E}[\varepsilon_{T+1}] = 0$ :

$$\begin{aligned}\hat{Y}_{T+1} &= 500 + 480 - 470 + 0 + (-0.4)(5) + (-0.6)(-3) + (-0.4)(-0.6)(2) \\ &= 510 - 2 + 1.8 + 0.48 = \mathbf{510.28}\end{aligned}$$

## Problem 5: Identifying Seasonal Period

### Exercise

Match each data type with its typical seasonal period  $s$ :

- ① Quarterly GDP data
- ② Monthly retail sales
- ③ Weekly restaurant reservations
- ④ Daily electricity demand

## Problem 5: Identifying Seasonal Period

### Exercise

Match each data type with its typical seasonal period  $s$ :

- ① Quarterly GDP data
- ② Monthly retail sales
- ③ Weekly restaurant reservations
- ④ Daily electricity demand

### Solution

- ① Quarterly GDP:  $s = 4$  (annual cycle over 4 quarters)
- ② Monthly retail sales:  $s = 12$  (annual cycle over 12 months)
- ③ Weekly restaurant reservations:  $s = 7$  (weekly cycle) or  $s = 52$  (annual)
- ④ Daily electricity demand:  $s = 7$  (weekly pattern) or  $s = 365$  (annual)

**Note:** Some series have multiple seasonal patterns (e.g., daily data may have weekly AND annual cycles).

## Example: Monthly Retail Sales Analysis

### Scenario

You have 5 years of monthly retail sales data showing clear December peaks and January troughs. Build an appropriate SARIMA model.

### Step-by-step Approach

- 1 **Visual inspection:** Plot shows upward trend + strong December spikes
- 2 **Seasonal period:** Monthly data with annual pattern  $\Rightarrow s = 12$
- 3 **Transformation:** Consider  $\log(Y_t)$  if seasonal amplitude grows with level
- 4 **Differencing:** Try  $(1 - L)(1 - L^{12})Y_t$  – check ACF/PACF
- 5 **Model selection:** Start with airline model, compare via AIC

## Example: ACF/PACF Interpretation for Seasonal Data

### Observed Patterns (after differencing)

- ACF: Significant at lags 1, 12; cuts off after lag 1 and lag 12
- PACF: Significant at lags 1, 12, 13; decays at multiples of 12

### Interpretation

**Regular component:** ACF cuts off at 1  $\Rightarrow$  MA(1)

**Seasonal component:** ACF significant only at lag 12  $\Rightarrow$  seasonal MA(1)

**Suggested model:** SARIMA(0,  $d$ , 1)  $\times$  (0,  $D$ , 1)<sub>12</sub> – the airline model!

**Alternative check:** If PACF showed cutoff at seasonal lags instead of ACF, consider seasonal AR terms.

## Example: Python Implementation

### Fitting SARIMA in Python

```
from statsmodels.tsa.statespace.sarimax import SARIMAX
import pmdarima as pm

# Manual fit
model = SARIMAX(y, order=(0,1,1), seasonal_order=(0,1,1,12))
results = model.fit()
print(results.summary())

# Automatic selection
auto_model = pm.auto_arima(y, seasonal=True, m=12,
                           start_p=0, max_p=2,
                           start_q=0, max_q=2,
                           d=1, D=1,
                           trace=True)
```

## Example: Interpreting SARIMA Output

### Sample statsmodels Output

```
SARIMAX Results
=====
Model:          SARIMAX(0,1,1)x(0,1,1,12)    AIC:      1348.52
                                           BIC:      1358.21
=====
              coef    std err          z      P>|z|
-----
ma.L1         -0.4018      0.072     -5.58      0.000
ma.S.L12       -0.5521      0.081     -6.82      0.000
sigma2        1254.3201    142.856      8.78      0.000
```

### Interpretation

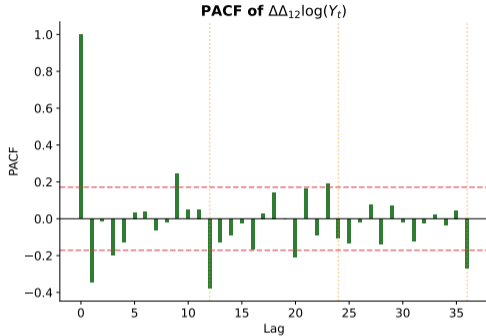

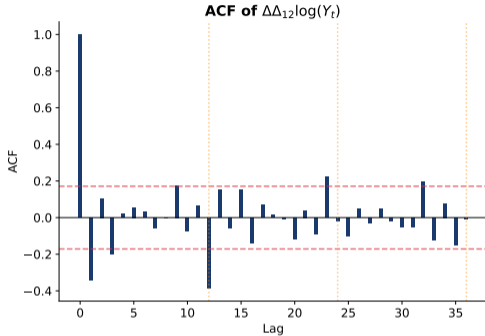

- $\hat{\theta}_1 = -0.40$ : Negative MA means positive shocks reduce next period's value
- $\hat{\Theta}_1 = -0.55$ : Same-season correlation is captured
- Both coefficients significant ( $p < 0.001$ );  $|\theta|, |\Theta| < 1$  – invertible

## Case Study: Airline Passengers (1949–1960)

- Classic Box-Jenkins dataset: 144 monthly observations
- Clear **upward trend** and **seasonal pattern** (summer peaks)
- Seasonal amplitude **grows with level**  $\Rightarrow$  multiplicative seasonality
- Suggests: log transformation + SARIMA modeling

## ACF/PACF Analysis After Differencing

- After  $(1 - L)(1 - L^{12}) \log(Y_t)$ : series appears stationary
- Significant spike at lag 1 in ACF  $\Rightarrow$  MA(1) component
- Significant spike at lag 12 in ACF  $\Rightarrow$  Seasonal MA(1) component
- Pattern suggests: **SARIMA**(0, 1, 1)(0, 1, 1)<sub>12</sub> (airline model)

## SARIMA Estimation Results: Airline Data

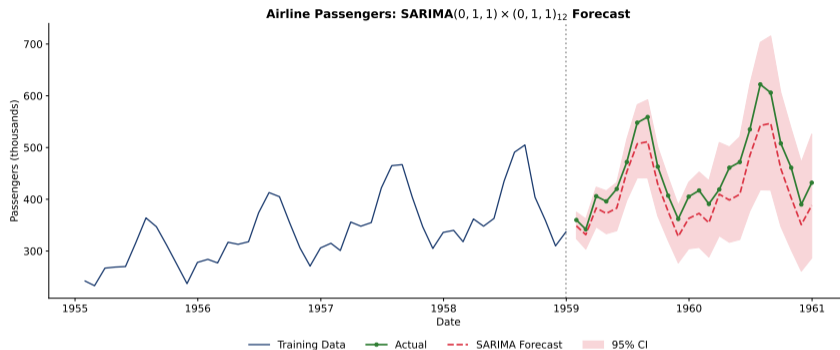

Model: SARIMA(0, 1, 1)(0, 1, 1)<sub>12</sub> on log(Passengers)

| Parameter             | Estimate | Std. Error | z-stat | p-value |
|-----------------------|----------|------------|--------|---------|
| $\theta_1$ (MA.L1)    | -0.4018  | 0.0896     | -4.48  | < 0.001 |
| $\Theta_1$ (MA.S.L12) | -0.5569  | 0.0731     | -7.62  | < 0.001 |
| $\sigma^2$            | 0.00135  | —          | —      | —       |

### Model Fit Statistics

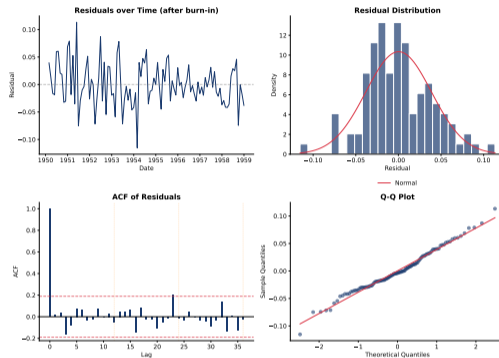

- Log-Likelihood: 244.70
- AIC: -483.40, BIC: -474.53
- Both MA coefficients significant and within invertibility bounds

## Forecast: 24 Months Ahead

- Forecasts capture both trend and seasonal pattern
- 95% confidence intervals widen over forecast horizon
- Seasonal peaks (July-August) and troughs (February) clearly visible
- Model successfully extrapolates the multiplicative seasonal pattern

# Model Diagnostics

- Residuals appear random with no systematic patterns
- Distribution approximately normal (Q-Q plot close to diagonal)
- ACF of residuals within confidence bounds – no significant autocorrelation
- Ljung-Box test:  $p > 0.05$  at all tested lags  $\Rightarrow$  adequate model

# Discussion: Deterministic vs Stochastic Seasonality

## Key Question

When should you use seasonal dummies vs SARIMA for seasonal data?

## Considerations

**Seasonal dummies** (deterministic):

- Fixed, repeating pattern each year
- Same December effect every year
- Appropriate when seasonality is stable

**SARIMA** (stochastic):

- Evolving seasonal pattern
- This year's December depends on last year's December
- Better when seasonal amplitude varies

## Key Question

When should you take logarithms before fitting SARIMA?

## Guidelines

**Use log transformation when:**

- Seasonal fluctuations grow with the level (multiplicative seasonality)
- Variance increases over time
- Data is strictly positive (prices, sales, counts)

**Avoid log when:**

- Seasonal pattern is additive (constant amplitude)
- Data contains zeros or negatives
- Already on a rate/ratio scale

**Tip:** Compare AIC of models with and without log transformation.

## Discussion: Multiple Seasonalities

### Challenge

Daily sales data may have both weekly (7-day) and annual (365-day) seasonal patterns. How do you handle this?

### Approaches

- ① **Nested SARIMA:** Model at shorter frequency, include longer as exogenous
- ② **TBATS/BATS models:** Explicitly handle multiple seasonalities
- ③ **Fourier terms:** Add sin/cos terms for each seasonal frequency
- ④ **Prophet/similar:** Modern tools designed for multiple seasonalities

**Note:** Standard SARIMA handles only one seasonal period. For complex seasonality, consider specialized methods.

## Key Question

What are the unique challenges of forecasting seasonal time series?

## Challenges and Solutions

- **Horizon matters:** 12-month forecast means predicting a full cycle
- **Uncertainty grows:** Seasonal forecasts compound regular uncertainty
- **Turning points:** Capturing when seasons peak/trough
- **Structural breaks:** COVID-19 disrupted many seasonal patterns

### Best practices:

- Use rolling-origin cross-validation
- Compare against seasonal naive benchmark
- Report forecast intervals, especially at seasonal horizons

# Take-Home Exercises

- ❶ **Theoretical:** Show that  $(1 - L)(1 - L^4)$  can be written as  $(1 - L - L^4 + L^5)$  and explain what this transformation does to quarterly data with annual seasonality.
- ❷ **Computation:** For  $\text{SARIMA}(1, 0, 0) \times (1, 0, 0)_4$  with  $\phi_1 = 0.5$  and  $\Phi_1 = 0.8$ , write out the full AR polynomial and identify all non-zero coefficients.
- ❸ **Applied:** Download monthly airline passenger data and:
  - Plot the series and identify trend/seasonality
  - Apply appropriate transformations
  - Fit the airline model and interpret coefficients
  - Generate 24-month forecasts with confidence intervals
- ❹ **Comparison:** Fit both  $\text{SARIMA}(0, 1, 1) \times (0, 1, 1)_{12}$  and  $\text{SARIMA}(1, 1, 0) \times (1, 1, 0)_{12}$  to the airline data. Compare using AIC, BIC, and residual diagnostics. Which is preferred?

### Hints

- ❶ Expand  $(1 - L)(1 - L^4) = 1 \cdot 1 - 1 \cdot L^4 - L \cdot 1 + L \cdot L^4 = 1 - L - L^4 + L^5$
- ❷ AR polynomial:  $(1 - \phi_1 L)(1 - \Phi_1 L^4) = 1 - 0.5L - 0.8L^4 + 0.4L^5$
- ❸ For airline data:
  - Use log transformation (multiplicative seasonality)
  - Both  $d = 1$  and  $D = 1$  needed
  - Typical estimates:  $\theta_1 \approx -0.4$ ,  $\Theta_1 \approx -0.6$
- ❹ The MA-based airline model typically fits better than pure AR seasonal model for this data (lower AIC).

# Key Takeaways from This Seminar

## Main Points

- 1 Seasonal differencing  $(1 - L^s)$  removes stochastic seasonality
- 2 SARIMA notation:  $(p, d, q) \times (P, D, Q)_s$  separates regular and seasonal
- 3 The airline model is surprisingly effective for many datasets
- 4 Multiplicative structure creates interaction terms
- 5 ACF/PACF show patterns at both regular and seasonal lags
- 6 Log transformation often needed for multiplicative seasonality

## Next Steps

Chapter 5 will cover multivariate time series: VAR models, Granger causality, and cointegration.
